                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence comprises the P. aeruginosa ANR promoter sequence. It was used in the construction of the pathogen and tissue-specific toxic agents of the invention. These agents may be antisense sequences, ribozymes or toxic proteins. These can be used in the treatment of cancer and infections including hepatitis, herpes, malaria, bacterial meningitis, typhoid feyer and tuberculosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention provides a recombinant nucleic acid (I) comprising a cosequence that encodes an autocatalytically cleaving ribozyme (ACR) and compared that encodes an autocatalytically cleaving ribozyme (ACR) and compared to treat infections (bacterial, viral, fungal or parasitic) or to pathogen specific of becase, especially proliferative or malignant compared to cultured cells or tissues, or to plants, humans or other compared to cultured cells or tissues, or to plants, humans or other compared to cultured cells or tissues, or to plants, humans or other compared to cultured cells or tissues, or to plants, humans or other compared to cultured cells or tissues, or to plants, humans or other compared to cultured the sevential or microbial gene products that are possible targets for therapy. The ribozymes are both specific compared cells and subject to tissue or cell-specific expression.

Consider the particular targets delivery of ribozyme to the pathogen. Where compared cells and imposed containing (I) that include a pathogen. Where compared as antimicrobials, multi-ribozyme will not be affected by inherent compared to the custom delivery of ribozyme to the pathogen. Where compared as antimicrobials, multi-ribozyme will not be affected by inherent compared to the custom delivery of probably with a compared compared that several RNA targets (probably with a compared compared the compared to be selective for particular organisms; do not require a replicating delivery vehicle; are consisted in animal models. The present sequence represents a pseudomonas confirm invention of the invention.

The invention relates to the discovery, identification and characterisation of toxic agents lethal to pathogen and methods for targeting such toxic agents to a pathogen or pathogen infected cells in order to treat and/or eradicate the infection. In particular the invention relates to at least one nucleic acid molecule, which separated with the transformation or plasmid copy number control, which associated with the transformation or plasmid copy number control, which hybridises to a viral polyadenylation signal or a core, pre core or hybridises to a viral polyadenylation signal or a core, pre core or copy polymerase encoding sequence. Specifically, the invention relates to the delivery of one or more toxic gene products, antisense RNAs, ribozymes, DARzymes or a combination thereof. The nucleic acids have antiviral activity and can be used in gene therapy. They are useful for the treatment of papilloma or hepatitis virus induced conditions and can produce a cytotoxic or cytostatic effect in papillomavirus or hepatitis B

                                                                                                                                                                                                                                                                                                                                                                                                                      neuron specific manner and consequent protection of neuronal cells from apoptosis suggests that Brn-3a may co-ordinate some aspects of neuronal reorganisation during development or following injury. The elevation of Brn-3a expression by either pharmacological means (compositions comprising one other therapeutic polypeptide e.g. neurotrophic factors, nerve growth factor (NGF), cillary neurotrophic factor (CNTF), brain-derived neurotrophic factor (BNTF), and neurotrophins NT-3 and NT-4/5) or gene therapy may represent a method for treating human diseases associated with excessive neuronal cell death and/or lokk of herve regeneration, especially neurodegenerative diseases such as familial dysautonomia and infantile muscular dystrophy, and Parkinson's and Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Over expression of transcription factor Brn-3a can protect neuronal cells from apoptosis. Brn-3a also specifically activates expression of the BCl-2 gene in neuronal cells and this activation is mediated via a Brn-3a response element in the 5' regulatory region of the Bcl-2 gene. Both the anti-apoptopic effect of Brn-3a and its ability to activate expression of Bcl-2 are mediated by the N-terminal domain of Brn-3a. Members of the Bcl-2 family perform critical roles in the regulation of selective apoptosis during development of the nervous system. The stimulation of Bcl-2 expression by Brn-3a in a

Expression of HPV proteins is generally dependent on the presence of Brn-3a in the cell. Methods of identifying Brn-3a binding agents or agents which inhibit Brn-3a expression are claimed. Nude mice were injected with SiHa cells containing a single integrated HPV16-genome were transformed with a Brn-3a antisense construct and with the empty expression vector as control and tumours assessed at regular intervals. Results showed that after 30 days there was no or very little tumour growth in mice transformed with Brn-3a antisense construct as compared

                                                           WPI;
         New zinc finger protein and gene encoding it for detecting diagnosing cancer, estimating the risk of carcinogenesis, \boldsymbol{\epsilon}
                                                                                                                                                                                                                                                                                                                                                                                                                               AAH41549 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a combined DNA/RNA molecule designated Rit1, which has a 2-3 type zinc finger structure and tumour suppressor activity. Rit1 has cytostatic activity and can be used in gene therapy. Genomic or cDNA encoding Rit1 can be used in the detection and diagnosis of cancer, and the estimation of the risk of carcinogenesis. Rit1 and its partial peptides are also used to detect and diagnose cancer, and estimate the risk of carcinogenesis. The present sequence encodes

Ritl has cytostatic activity and can be used in gene therapy. Genomic or cDNA encoding Ritl can be used in the detection and diagnosis of cancer, and the estimation of the risk of carcinogenesis. Ritl and

Ritl has cytostatic activity and can be used in gene therapy. Genomic or cDNA encoding Ritl can be used in the detection and diagnosis of cancer, and the estimation of the risk of carcinogenesis. Ritl and its partial peptides are also used to detect and diagnose cancer, and estimate the risk of carcinogenesis. The present sequence encodes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genomic or cDNA encoding Ritl can be used in the detection and di of cancer, and the estimation of the risk of carcinogenesis. Ritl its partial peptides are also used to detect and diagnose cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a combined DNA/RNA molecule designated Ritl, which has a 2-3 type zinc finger structure and tumour suppressor activity. Ritl has cytostatic activity and can be used in gene therapy
                                               Uniform amplification of heterogeneous mixture of nucleic acid templates of varying G+C content, comprises amplifying the reamixture in the presence of betaine and dimethyl sulphoxide -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1531
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1591
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1651

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     octamer binding protein OCT-T1. It was used as a test sequence in an CC assay to demonstrate the method of the invention, which involves a novel CC way of amplifying GC rich nucleic acids. In addition to the normal CC mixture a zwitterion and a compound which disrupts base pairing are added CC to the PCR reaction. The zwitterion is preferably betaine (trimethyl CC glyche), D-carnitine, dimethyl glycine or monomethyl glycine, and the CC base pair disruption compound may be DMSO, formamide, sodium perchlorate CC or glyoxyl, among others. This method is useful as it allows the uniform CC and more efficient amplification of nucleic acids composed of GC rich CC regions. This is useful in DNA library construction, as the 5' end of CC genes are often GC rich, and in the diagnosis of diseases where GC rich CC muscular atrophy, myotonic dystrophy, Huntington's disease and XX spinocerebellar ataxia type 1.

The protein is a tumour rejection antigen precursor (TRAP). The specification describes the treatment of disorders which characterised by expression of a leukaemia-associated nucleic acid such as TRH. The products are used for in vivo or in vitro screening for leukaemia, lymphoma or other cancers by usual hybridisation/amplification or immunoassay methods. TRAPs, when processed to antigens or complexed with HIA (human lymphocyte antigen) molecules, or nucleic acid encoding them, are useful in vaccines for received.

DNAs encoding the BCKDH E1-alpha, E1-beta, an N-terminal and internal portions of the E2 subunit (AAQ83793-96) were obtained. A genomic sequence including the E1-alpha, E1-be and E2 (partial) bkd ORFs was also isolated (AAQ83797). Manipul of bkd genes allows the enhanced production of natural or novel

(I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;
(e) selecting a composition for inhibiting prostate cancer in a patient;
(f) assessing the prostate cell carcinogenic potential of a compound;
(g) determining whether prostate cancer has metastasized in a patient;
(h) assessing the aggressiveness or indolence of prostate cancer in a

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton

In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one cDNA library was made, and I million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Choi, Close). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence above. For more details on library preparation and seminence analysis see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Conservative

/note="Vector: Lambda Uni-ZAP XR, excised phagemid;
Site_1: EcoRI; Site_2: XhoI; Seeds were surface-sterilized
, germinated and grown aseptically in the dark at room
temperature on filter paper with water, nystatin and
cefotaxime in covered crystallization dishes. Shoots were
harvested. The tissue, total RNA, and poly(A) RNA were
prepared, a cDNA library was made, and the cDNA clones
were in vivo excised to give pBluescript phagemids in the
TJ Close lab (Choi, Close, Fenton) at the University of
California, Riverside. Plasmid DNA preparations and DNA
sequencing were performed in the OD Anderson lab (all
other authors)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note="Organ: Anthraconose-infected leaves from
two-week-old sorghum plants 48 hr after inoculation;
Vector: pBluescript II from Lambda Zap II; Site_1: XhoI;
Site_2: EcoRI; Two-week-old sorghum plants (BTX 623)
cultivar) were infected with pathogen (isolate FRW42I of
Colletotrichum graminicola, which is a sorghum isolate).
RNA was prepared from infected leaves harvested from 45
seedlings 48 hours after inoculation. Note: young
seedlings (2 weeks old) exhibit juvenile resistant
reaction, which is an incompatible interaction. As they
grow older (4 weeks or older), plants resume susceptiblity
to anthraconose disease. The library was made from poly-A
